The dramatic change in Aten's fortunes has been due to one menfortunes has been due to one mental the second of the second o

The Man...aiming for another billion

A FORMER Commodora amployae who ran afoul of Jack Tramial was asked whether or not his ax-boss would make a good President of the United States. The trouble with Jack he

The trouble with Jack, he replied, "is that while he certainly has the ability, he just isn't democratic enough. Although he likes to do things for the people, he wouldn't want to be ensured be to them."
This may simply have been a case

This may simply have been a case of sour grapes. After all Tramie's footprint still showed on the seat of the executive's trousers. But swen those closes to Jack readily ednit that he sometimes comes across like a wounded elephant, trampling underloot everyone and averything in

his path.

And this is why the new boss of Asiri has the reputation of being the most feared — yet at the same time most respected — personality in the computer industry today.

When Jack Tramiel is around, he

isn't just a man. In the language of the ghetto, he's THE man — end you'd better believe it. At the end of a corporate battle involving the head of the Tramiel clan it is said that he will not welk away until his victims' blood is splattered on the walls and the ceiling as well as the floor.

the floor. It is this suthless approach – some would argue it's just good business – which enabled him to lead Commodore to become the first personal computer company to pass the major \$1 billion turnover milestone. And now he intends to serve up the same for Alact, the compenny which he asser for Alact, the compenny which he

same for Asser, the compeny wencer he had previously helped to bring to its knees.

Not that Jeck Tramiel is overly concerned with what people say about his methods. He only ceres for being a winner—as that end result for

him will always justify the means.
"I believe business is war", is one
of the Ateri chief's fevourite sayings.
No one who knows him doubts his
word.

Once asked to comment on the high tumover of executives while he was at Commodore — the stending joke at the time was you get a gold watch if you lasted a year — he said: "Our generals are all in the trenches — so more of them get killed".

However when Jeck Tramiel comes out on top he's not the only winner. For his entire business philosophy is besid on the belief that the only way to make money is to give

the customer true value.

"It is this more than enything else about Tramel which bodes well for anyone who ever bought an Aterior is even thinking about buying one", an industry observer told me.

"With Jeck you know he'll be in your corner fighting all the way. He's a street fighter from way beck, end if he loses a few more executives than most along the way, he won't lose any aleso ebout it."

However those of his lisutements who survive the rigours of the compaigns are richly rewrited for the absolute loyalty, supreme expertise and total commitment demanded. More people at Commodore ended up millioneires in their own right than

up millioneires in their own right than in any other high tech corporation in Silicon Valley. Bonus payments of up to 100 per cent of salary plus substantial ellocations of shares as w "There's a touch of the godfether

about Jeck", seld yet another Commodore men whose name never made the corporate roll of honour. "His generoeity knows no bounds. but neither does his wreth. You may not and up wearing a concrete overcoat, but the message is much

Beid and inhund, at 55 years of ane Jack Tramiel could be mistaken for somebody's favourite uncle. In fact he

would not seem out of place dishing out begels and lox behind the counter of a delicatessen. It's only those heavily hooded shrewd eyes which provide the clue that here is a man whose character

has been forged on the envil of adversity - a men to be reckoned As benefits a former New York cebbie, it doesn't take long to figure out that doing business with him will

meen peying full fare - and not getting any change Yet those people who expect Jack Tremiel to surround himself with

sycophents would be wey off merk. For he enjoys nothing more than confrontation - "the more, the better" - with members of his team. Constantly punctuating his remarks by benging his fist on the deak top, he demends ever more from hea hard pressed executives. And with Nm it is argument he seeks, not

discussion. The people he most likes to have eround him ere the brillient mavericks who do not always follow the rules. Jeck Tremiel, you see, is not entirely sold on rules. For rules often become orders which must be obeyed. And these, in turn, here been known to become excuses for some

of the worst aveauses of human And the young Jack knew only too well about these Bom in Polend he was provided with a "ticket to half" at the ege of 11 when a number was burned into his flesh on entering

He meneged to eurylve the wer as a sleve labourer working on road construction - "they had to feed us or we wouldn't have been able to work Somewhat aurprisingly Jack the Germane or Germany today. In fact he chose to build a factory there close to an eutobahn on which he had

Asked why he would provide amployment for the people who

persecuted his rece, he enswered simply: "I live in the future At the end of the war he moved to the United States, joined the army

there and learned to repair typewriters. It was this skill which was to set him on the road to joining the renks of North America's self-made immigrant millioneires. His wesn't to be an overnight rags

Once he beceme a civilian again he used his newfound skill to leunch his

the fladding company to successful that it went public in 1962. And so the Commodore Portable Typewriter Corporation was born. Three years later it nearly collegsed when its major backer, C.P. Morgen, was found to have built his

in the wake of the adverse publicity Commodore was unable to get credit. It was only an anneal by Jack Tramiel to financier Irving Gould

which resulted in the company being bailed out at the eleventh hour To persuede the money men to come up with the lifeline, Jack turned over all of his stock with the proviso

that some of it - an undetermined amount - was to be returned once Commodore was beck on its feet It was only a matter of months

before Jack Tramiel found himself once more with a piece of the action. So he adjusted his corporate gum modore comer fighting Steering the company into the

lucrative but voletile calculator market, he suddenly found himself at war for the first time with the big

Texas Instruments was to eventu ally win the ugly battle for the main American market, leaving Jack Tremiel bloodied but unbowed. For he

was to enable him to make a triumphent comeback - e cheap computer for the masses. Having at one time briefly considered buying Apple, he opted out in

development teem. And such was the excitement generated when he eventuelly unveiled the Commodore Pet that customers fell over themselves to pay for it in full in advance - then wait six months for delivery. It ween't long efter that he decided to invade Europe, a place for which he

has always had a soft spot. that the Europeans are much more appreciative of value for money than

that is what he was offering With no real competition fecuna Commodore in Europe in the late 70s. he was soon able to capture 80 per

cent of the market in the UK and So with honming seles on both sides of the Atlantic, his much quoted easing "We make computers for the marrier not the classes, became a

fact of life. In fact it was during Commodore's heyday that Jack Tramiel earned himself the reputation of being the

source of memorable phreses. Business is like sex", he once told en interviewer. "You have to be

And when discussing the possible threat of the MSX machines, he was moved to utter: "The Japanese are coming - so we will become the Jepanssa

Yet It is his almost God-like commandment to Moses phrase - "It will be done" - which still echoes in the ears of his former colleagues. When Jeck Tremiel resigned from Commodora after an apparent dis-

agreement with Gould, shock waves reverberated through the industry for months.

Now that Jack is back - this time at Atari - nothing much seems to have changed. Already members of his former Commodore clen - even some he unceremoniously dumped have been clemouring to get back on

board, such is the cherisma of the When Warner Communications relinquished control of Atari to Tramiel few tears were shed. After all, the company had lost \$500 million in

simole. First in the renge to ecrive in Britain will be the 520ST, which has 5126 RAM, Both it and the 128k 130ST hour 1924 BOM expendable sin the cartridge alot to e maximum of 320k. With a list of features like thear and a nrice well below comperable mechines, it's no wonder the ST is causing such a lot of excitement.

TO ATAN LISTE May 1905

New XE looks good - and FIRST of the new-look Ateri it IS good!

machines to hit the British market is the 130XE, Like the previous generations of Ateri - the 400/800, 1200XL and 800/800XL - it is based on the 8 bit 6502 chip. In sexual fact, the new machines

use, the 85CO2 a more modern version of the chip which has a few extra commands and uses less power. The 130XE is far more than just a good-looking version of the 800XL For one thing it has a massive 128k of RAM - together with meny other new feetures, product improvements and manufecturer's cost reductions. All of which will help to make it a

winner right from the start it has a great degree of flexibility in its screen display found in no other product line. It has 16 screen modes -11 graphics and five text - player/ missile graphics and four voice sound. On the outside there's a bright new design. The keyboard has been improved and feels better than ever. and the femilier function have -Select, Option and so forth - are now

nositioned across the top of the keyboard If you're wondering about the certridge slot - don't. It hasn't been forgotten. It has switched from the top of the machine to the back. So you'll still be able to run ell your miliar cartridge softwere. Another major difference between the 130XF and the 800XL is that the new machine dozen't have the parellel input/output (PIO) connector on the back. However it should hardly

be missed - Atari didn't use it for There will be two other mechines in the XE range - the 65XE and the

The 65XF will have 64k RAM and the R5XFM has a similar specification. in everything except the sound. You can think of the Miss standing

for Music because instead of the stendard four sound channels the XEM has sight channels and 64 harmonics. The superb quality sound is echieved by using a sampling rete of own 30kHi

You may have read alsowhere of a 65XEP model. This was intended to bs a portable varsion of the 65XE, but will not now be produced. However for those of you on the move, you may like to know that a 16 bit portable is oromised instead One vital feature common to all in

the XE series is compatibility with previous Atari machines - which means that the existing base of software, peripherale end applicetions will survive without growing

MENTION the Atari ST range end the chances ere that within the next few seconds someone will say "GEM". The ecronym on everyone's line looks sat to become the operating system of a whole new generation of micros. and with good reason. Oigitel Research, the company that gave us what is ergusbly the

least user-friendly operating system In the form of CP/M, is now set to unleash its Graphica Environment Menager and show that the leggard can indeed change its spots.

So while we're looking at the ST let's look at GFM and what it will muon for Ateri users. In the days when CP/M was

developed most programs had nothing more than text output. Consequently, it ween't too difficult to capitalise on the Z80 architecture and produce an operating system which could be implemented on practically any Z80-based micro. On the wings of this operating

system such programe se Wordster flew to fame. While it was undoubtedly a good program, it could never have achieved the eminence it did without CP/M Then came graphics, Suddenly the

world was brighter for the user, but infinitely darker for the commercial For while most mechines incorporated primitives to print charecters

to the screen, the number of systems for handling graphics was almost equal to the number of brends of In courts terms. GFM is a prephics. equivelent of CP/M, but this time not tied to a particular chip. However in

order to do justice to GEM we need to consider another historical strand. That is the one which stratches back from Apple's Mecintosh to the research conducted by Xerox at Pelo Alto. As Jack Tramiel has pointed out GEM doesn't copy Mecintosh so much as draw on the "deakton metaphor" which came out of the Xerox research.

Whichever way you look at it, the result is the WIMP philosophy -Windows Icons Mouse Programs Recause they share the same undarlying ideas GFM acreans and Macintosh screens have a definite similarity. Of course the major difference is

It's a GEM of an

operating system!

seams to have mede is in assuming that the user friendliness is a function of the Macintosh, whereas it is actually a function of the underlying philosophy.

While the Mecintosh is a delightful "one-off", GEM has the edventeeps.

"one-off", GEM has the adventege that progrems can be easily ported between michines which support the operating system — and this time OR haven't tied it to a persouler chip. For while Ater's ST range is the

haven't fied it to a particular chip.

For white Ateri's ST range is the most publicised supporter of GEM, the system will become evallable on the STANDARD RESIDENCE IN THE STANDARD RESIDENCE IN THE STANDARD RESIDENCE IN

could be implemented on eny machine which supports a C compiler — which includes the Macintosh. The advantages of a portable

The advantages of a portable operating system might not be immediately apparent to the owner of a eingle migro. However when it comes to buying software the advantages become obvious. Ion Turner, Ashton-Tate (UK)'e technical director, neathy awmmarises the advantage: "CBM offers on the advantage."

the adventege: "GEM offers on up-to-dete, very user friendly environment vital to the continued development of complex integrated packages

you might in your treditional filing oablies. You can even put folders within other folders.

The GEM desktop also gives you access to the sort of tools you'd normally have on your deak. Whe e calculation — no more servebing through

the dask deswerz when ell you went to do it one guide catusferior. Sciences and peptralips are also there, along with the most what pert of any office—the weste paper beaket! With GEA, moving, information between files becomes much simpler. You can write the olds of a report with you can write the olds of a report with you can write the olds of a report with you can write and office the olds of a report with you can write and office the olds of a report with you can write and office the olds of a report with your can write and office the olds of a report with your can write and office the olds of a report with your can write and office the olds of a report with your can write and office the olds of a report with your can write and discharge the olds of the olds of

"For Ashton-Tate, which is not committed to a sole machine or system, GEM's easy portability etrongly supports our future development strategy".

This meens that with GEM on the Ateri ST you can look forward to a wealth of powerful software while anjoying the same of user friendliness.

More then 70 UK eoftware compenies ordered the GEM Programmer's Toolkit on the first day it was available in this country. Hence the ST shouldn't need to rely on imported – and therefore artificially expensive – software, ee has the Macienzels.

All in all, the value for money offered by the Atail ST range and the edvantages of GEM in terms of user friendliness and software availability look. like producing a winning combination.

In the words of Sam Tremich: "We have seen that the most advanced processing the most advanced introcomputer technology for consumers to learn and use personal computers. It will help piece Atrai in a position to offer a powerful, easy-touse personal computer at a fow-cost". Unusually in the micro industry, this time the hose he an adval lat of

truth in it.

AS an operating system, GEM interfaces between the user and the metable, thousers, what makes GEM different is its extreme user threadlines. Treditional computer commends and heyboard entries have been replicated with easy-fo-understead graphic images and an easy-fo-use pointing device called a moure.

Across the top of a GEM screen you? see Menu dars. Whose does rouching the Aephand, you can use the mouse to just darw? one of the menus and make a selection form? one of the menus and make a selection form. It? is a surprise as thet. Organizing your work is so much easier with GEM. By menjousticing the screen display with the menu, you can collect a size of files into a follow hus as collect a size of files into a follow.

To help you make the most of your Atari

Why you should give your Atari

Disc Power!

Look what you get when you link your Atari to the versatile 1050 Disc Drive: It's speedy! You'll be amazed at how quickly your programs load and save. No more tedious waiting!

It's sure!

Disc systems are inherently more reliable and flexible than cassettes. No more lost files! Despite its amazing

It's simple!

capabilities, using the disc drive couldn't be simpler: it's easy to fit and even easier to operate!

With the 1050 comes DOS 3, Atari's latest disc operating system. Featuring a wide range of utilities, DOS 3 supports both single and dual density modes, so you'll be able to take advantage of the wealth of disc software that is now available

And to get you going, we're offering £17 off this special disc storter pock! The Pay-Off. An exciting edirentum same Home Filing Manager, A powerful

LECOM GOLD

COMBINE the enthusiasm of thousanda of micro users with the mainframe power and versatility of Telecom Gold and the result is a vast, nationwide communications link that will open up an exciting Go online to MicroLink and you're immediately

connected to a rapidly-develoing network of information and personal computing power. And all you need to become part of MicroLink is you Atari computer and an appropriate modern and software, such as the Miracle package described

Communicating the MicroLink way is not only fast - It's much cheaper than you might expect. For instance, even if you live outside the London 01- call area you can still get direct access to the Telecom Gold meinframe computer at local call

You can use your electronic mallbox to send a shole-page letter for less than the cost of a first class stamp. And you can send the same message to 500 different destinations in the UK for no extra charge. (ft would only cost you 30p more to send 50 copies to your friends in Australial) And you don't need to be a computer genius to use MicroLink! You get instant access to dozens of services with plain English commands, or by

selecting what you require from a aimple menu And the cost of uning MicroLink? Just £3 o month. Plus small additional occess charges which are fully detailed in our information pack. To totaln your copy, fust tick the appropriate section of the coupon on Page 61.

Telecore Gold to the tredemark of British Telecommunications pilc

world micros are talking to each other over the telephone line. As well as to the ever-increasing number of public and private databases, bulletin boards - and even giant mainframe comouters We want all Atan User readers to share in the new

technology that makes all this possible. So we're offening a unique starter pack at an unbeatable once. It gives you everything you need to get in touch with the big wide world outside: Modem

 Software · Serial Interface

The modern is the amazing Miracle Technology WS2000. One of the most powerful on the market, it provides all the facilities you require. Yet it's simplicity itself to use Just plug it into a standard British Telecom sack and you're away!

The package also features the superb Datari serial interface, which links the modern directly to the Atan's peripheral port without the need for the 850 senal interface The best hardware deserves the best software to drive it. and with the comprehensive Multi-Viewterm programs the

nackage is complete. It supports all the standard boud rates -1200/75, 75/1200, 1200/1200 and 300/300 full duples Your Atari User package will allow you to talk directly to other computers, to send your own telex messages, to go tele-shopping - even to download free software programs directly into your Atari

You will be able to join Micronet/Prestel, which will immediately open up to you a vast menu of 750,000 pages of information - instant world news, sports, holidays, hotels, train and airline timetables, all regularly updated. And you can become one of a growing number of enthusiasts who are joining MicroLink, the giant database set

up in conjunction with Telecom Gold, which is described more fully alongside. But first, send for the Miracle package - and enter the fasonating, limitless world of communications!

Experience the thrill of a REAL arcade game at home!

And no matter how many times you play QIX, you'll never play the same game twice -This is the game every Atan user ought to have by his machine - so we're offering our readers £2 off the normal price.

You don't just play OIX-you FEEL it!

A message from

ENGLISH SOFTWARE... to all owners of

ATARI, COMMODORE 64. BBC B. ACORN ELECTRON and AMSTRAD Computers...

Software companies grow on trees ... at least that's the way it seems from the number of new companies springing up every

Week ENGLISH SOFTWARE was launched three years ago with a smashing little game for Azari Computers called AIRSTRIKE 1 which quickly became one of the most popular U.K. program

Then, as now, Atari Computers were amongst the most advanced on the planet, but they were a TRIFLE expensive

Acan software produced by EHGLISH SOFTWARE But Atari owners used to be a funny lot, being heard

to utter such gerns as "It can't be any cop. If it costs less than £20" Honestly, that's what they used to say! Anyway. In the face of this rather strange attitude, we went

ahead and committed the ultimate six: ATARLGAMES AT £9.95 We expected some slight resistance to these

prices from Ateri owners who only equated blob quality with high prices, but we were wrong Everybody thought the prices were great, and the games tool We even produced the fantastic ATARICASSETTE

ENMANCER at £7.95, a superbutiley program for **BASIC** programmers So now, for those of you who might have missed out on alliquir excellent Ataritities, we are releasing something

very, very special ATARISMASH HITS Volumes 1, 2 and 3 from ENGLISH SOFTWARE

Twe great games on one cassette for only £14.95. Each cassette features our top rated JET-BOOT JACK plus four other popular titles. So now you have no excusto miss out on the best range of U.K. produced Atan 400/800/600XL/800XL software for 32K machines. If your

dealer does not yet have them in stock, ask him to order them from his nearest Atan wholesaler. It will be the best Atanbuy YOU will make all year! We have also just released COLOSSUS CHESS 3.0, the best chess program available aniwhere for Atai: 400/800/500KL/800KL computers with 48K. Very powerful, with lots of excellent features.

For our good friends with other home computers, our programmers are busy producing original games for you as well They are all llustrated on this page. HEHRY'S HOUSE on the Commodore 64, and JET-BOOT JACK on the Dectron are now available at selected branches of W.H. SMITH Selected English Software titles are available at: HARRODS and selected branches of LASKY'S, BOOTS, GRANADA COMPUTER

STORES, CO-OP STORES, THE SILICA SHOP Mai Order and THE ENGLISH SOFTWARE COMPANY 1 North Parade, Parsonage Gardens, Manchester M60 1BX TRADE ENQUIRIES WELCOME: 061-835 1358

Programming is easier than you think — and doubly so if you follow MIKE BIBBY's crystal clear guide through the micro jungle

I DON'T know who you are. You might be a wrife whose Arm to ever the covering husband is away at work, to or a fether who is trying to control to terme with his daughter (Christmas present. Alternatively you might be a teacher who has just been "computerised".

Whoever you are, the fact that you are reading this entitle tells entitle tells are reading this entitle tells and a control the arm of the control that was a support of the control that when the control the Arm micro.

program the Atari micro.

But how to begin? You must have noticed that some people take to computing like ducks to water, or an output port to an interface, as they would say.

Words like byte, strings and user-defined functions flow freely from their figs. They pass parameters and handle interrupts with ease, then get their hands on the peek and poke in e way that begans belief? You, I take it, are not like that. You are not a computer "naturel". But you would dearly like to be. Well feer not, this series is for you, and it was written by one of your kind.

written by one of your kind.

I, too, have sat at a keyboerd,
watching the cursor without having
eny idea of whet to do next for even
knowing it was called a cursor).

I also know what it's like to have
someone explain something to me in
the "simplest nossible trans" and still

the "simplest possible terms" and still find it way above my head. Yet I now programme reasonably well...end so can you. Read on! Let's essume for a start that you are seated in front of the computer.

which is already plugged in, connected to the TV and tuned in correctly. Some versions of the perior Ateris

will need a Basic cartridge plugging into the left certridge slot. If your Atari is of this sort, make sure the cartridge is in. And that is the end of our

The "On" switch is a rocker switch at the rear of the computer on the left. Reach over end switch on (and the TV if necessary). You'll heer some buzzing from the speaker of your TV and then the message READY will appear, together with a rockercular

blob, the cursor

If you're lucky enough to have a disc drive attached, keep it switched off for the moment - you won't need

it.
The READY message is called the prompt. This indicates that the micro

is reedy for you to type in some information. Try typing in two or three letters – just part of the alphebet for the moment, please.

You should soon see that the cursor indicates the position at which

cursor indicates the position at which the next letter will be printed on the screen.

Before we type eny more, let's

examine the Keyboard Fundementally, it is a standard typewriter keyboard surrounded by savesil additional keys. Notice that the computer has a O (zero) key en enother key for the letter O. You must keep the two separate-O's for numbers, O for words, I guarantee that e lot of your early errors in progrems will be caused by troping O

Insteed of 01
On the same lines, notice that
there is a 1 lonel key. Make sure you
do not use I. (Incidentally, a lot of your
other early errors in your computing
career will be from misreading 1 as 1
and vice-versa.)
Other laws are labelled by words.

euch as Shift, Esc end Return, Let's

irroduce e convention to make life easier: If I want you to press the key labelled Return, for instance, I will ask

[Return]

If I ask you to type RETURN you have to type B then E then T and so on The symbols II anclosing a word with that word on it. You do not spell

Now Return is quite an important key. We use it in a similar manner to the return key on an electric typewriter, to ensure that the typing continues on a new line. It is far more important than that, though, Beturn not only gives you a new line but also sends the message typed into the computer to be acted upon.

If you have been following so far. you should have tuned a few letters. on your screen so that it looks something like:

If not, type a few letters now. Next. press [Return]. Odds on, you'll get a . message back from the computer

Don't worry about the ERROR message. You can't hurt the comnuter by accidentally mistyning something, so feel free to experiment. All that ERROR means is that the computer doesn't understand the words worke just sent it. You see, it

needs to be spoken to in its own language, which is celled Basic However tearning Besic isn't like fearning a genuinely foreign language. Basic is very similar to English but it only allows selected English words - called keywords - to make

things simpler for the computer. This, by the way, is the reason I As far as the computer is concerned "end" and "END" are different words . . .

get EBBOB returned from the computer

You might by change, here hit on a Basic word. For example, in Basic you can mark the end of a renoram with END. The people who designed

Basic could have chosen the word FINISH to do this Type: END and press [Return]. Then try:

FINISH and press (Beturn). Note the difference!

Admittedly, END doesn't accomplish very much - after all, you haven't anything in there to end, have wou? - but at least the computer doesn't hurl the message ERROR at you es it did with FINISH. This is hecause END is a Basic word white

So far, your tuning should have been eppearing in upper case, that is capitels, only. Let's investigate. If you look at the lower right-hand corner of the keyboard you will see the keys Caps and Shift. All the letters

of the alphabet that you type will annear in capitals, unlike a typewriter which prints in lower case unless you hold down the shift key. In this state, which we cell "Cans Locked' pressing a key with two

characters marked on it will cause the lower character to appear on the screen. To obtain the upper character press the key while at the same time

said that it was odds on you would holding Shift down. For example, pressing:

will give you 6 on the screen while pressino:

and [Shift] will give you & on the

Here I introduce a convention: If I want you to press two keys at the same time, I join these keys with +-To enable the keyboard to function as a necessal temperature press [Capel H you type now, you will find that the alphabet eppears as lower cese unless you oress (Shift) down with it. when it will oppose as capitals. Remamber, if you want to get onto a new line, just press Return and joppre env resulting FRROR message. If you press [Ceps] once more you'll be back to the situation when

you switched on, with the alphabet accepting in upper case whether you press [Shift] or not Press [Canal once more and the letters will once more appear in lower case until shifted, and so on. At the moment the keyboard

should be ecting like a typewriter giving upper end lower case. If not, press [Ceps] once more. Get onto a new line by pressing

Insturnl end type: and [Return]

You should get ERROR, which proves that, as fer as the computer is concerned "end" and "END" are different words. It recognises "END" as the Rasic knowned but not "end" This is the reason for the Cane key. If you have this on, you autometically type in letters of the alphabet in cepitals, so prayenting you from mistakenly entaring "end" instead of "END". For the present I am going to

assume that all your typing is done with Caps on. If it is not on at the moment (which it won't be if you have been following) just cross that key once to rectify the situation. You've probably noticed that

holding a key down for more than a fraction of a second causes that letter to repeatedly type itself out on the screen. If you heven't try it now. This behaviour is known as the auto-

By now you will have probably filled up a screenful of text and seen the scroling action demonstrated. If not, press [Return] several times in succession or, more sophisticatedly. hold [Return] down and let the auto-reneet do the work for you. As you'll soon see, scrolling is when the too of the screen rolls up to allow more purion at the bottom.

You could if you wanted clear the screen like this, by keeping [Return] down until everything scrolls off the

An easier way to do this is to press the [Shift] key together with the key marked [Clear], which you'll find in the top row of keys on the right. Try

You can achieve the same effect by using the [Control] key instead of

(Shift). So (Control) + (Clear) will see the screan off, too [Control] is quite en importent key burt as we can combine shift and the

elphebet keys to alter what we get in the screen (capitals instead of lower case), so we can combine [Control] and other keys to give special effects. Try [Control] + 2. The micro should

been at you. We'll look at other uses of Control later. To conclude this preliminary examination of the keyboard I suggest that you clear the screen if necessary, then type in a few letters (without prassing [Return]). Now press [Delete] once. The last letter you typed should disappear, its position being taken by the cursor.

If you keep [Delete] down, the auto-repeat will function and arass your whole line. You can use this to correct typing arrors. Simply crose back to the mistake and retype. This is just one form of what is

called screen editing. There are other ways, involving the -. + . + . + end [Insert] keys, but these cen wait a

while Right, it's a computer so let'e get it to compute But don't worry, this isn't

going to turn into a mathematical treatise. After a brief but necassary foray into simple sums, this article is

thoroughly non-mathematical. Before we start, let me give you a warning. The computer will do exactly es you tell it but only what you tell it. respect is like my daughter on a

mischievous dey:

When asked to put on her pyjemes for bed she did exactly as she was told. Of course, I hadn't esked her to sike her other clothes off first, had I? You can imagine the results...

Smilar things happen with the computer. Say we want the computer to calculate 2+2. Not only do we want it to do the sum but we went it to tall us the answer when it's done it.

want it to do the sum but we went it to tall us the answer when it's done it. We instruct the Atari to write things on the screen with the Basic word PRINT. This is a relic from the days when the computer's output, as it is called, was actually printed out on

paper rather than on the screen as it is now. So, to see the answer to 2+2, type:

PRINT 2+2 [Return] Note that you don't need the =

sign as you do on e calculator. [Return] takes cere of that. Before continuing try e few simple edditions.

Just as the computer does not allow you to use O for 0, so it does not permit you to use X for multiply. The computer uses the symbol * instead.

For example try:

PRINT 4*3 [Return]

Minus (-) is straightforward. You'll find it sharing a key with an underline character and a vertical arrow. Divide, however, is not + but on oblique.

For example, 12+4 becomes: PRINT 12/4 [Return]

Though this mey seem at first a little odd to you, you have met it when dealing with fractions: 3+4 is equivalent to the fraction 3/4.

PRINT 3/4 [Return]

From now on I am going to essume that you accept that before the micro can act on your instructions, they must be sent to it by [Resum]. I may herefore om! [Return] from my eatmples. Make sure that you don't. Before experimenting with further sums of your own devising, I'd like yo, to try the following sequence:

PRINT 2+8-3 PRINT 4*8/2 PRINT 4*8+2 PRINT 4*(8+2)

If you think carefully about the results you'll see that the computer

interprats sequences of sums in the order you learned at achool. You do whetever is inside brackets first, then multiplication and division, then finally addition end subtraction.

PRINT 2/3 PRINT 10000*10000*10000 PRINT 1/1000

If you have done this correctly, your screen should display:

MART 2 / 3 E. Unidada PSAT 1004 + 1004 + 1004 (E-12

The point to stress here is that the computer works to a limit of socuracy. For example, 2/3 is not exactly 0.666666666. The error is well under a millionth, though. Sell, it must be bone in mind.

Similarly, with especially large

For E, which stands for exponent, you should read "multipliad by 10 to the power of "For example, 1E+12 means." In multiplied by 10 to the power of 1.2" which, If your maths is up to it, gives you the correct enswer. Similarly, the answer for 1/1000 was returned es 1.0E-03 which hadds as "I multiplied by 10 to the power of 3" which is 0.001. the correct

enswer.

If you don't follow all of this, don't warry. I've only covered it to wern you about odd looking results to your sums which might pop up and confuse you.

Now let's try to get the computer to print out some words. Let'il get it to print out Helio. If you dast your midback to your schooldeps (and for some of us that's en awful long throw), you'll remember that when someona seys something you surround what that prans asys with quotation marks (or quotes, for short), such as: He seld, "Helio".

In Besic, of course, we don't say

words, we PRINT them, but we do surround them by quotes. We omit, however, the comme and full stop. Try:

PRINT "Hello" [Return]

and the computer should print out

Hello.
Notice that the quotes are not printed. So to get the Atari Basic to print out a message on its screen we

just use PRART followed by mercage surrounded by quote.

The message inside the quotes is called a string - since the micro considers it to be just a string string testers - or a string ident. The latter is because the computer prints out literally, or exactly, what is between the quotes. So:

PRINT "Hello"
PRINT "Hello"
PRINT "Hello"

different numbers of spaces precede the Hello. Actually, strings do not have to be words. They can be any combination of symbols, including numbers. Just

keep them in quotes: Try the following: PRINT "4*3" PRINT 4*3 This should convene you that the

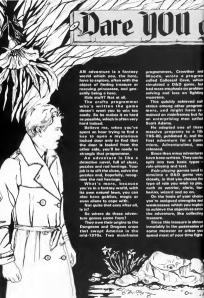

computer does print out strings—that is what is between the quotes—literally. When the calculation is in quotes the computer simply echoes the sum on the screen. When the calculation is not in quotes, the computer prints not the anower. Experiment with printing out various messages on the screen. How long can you make them? Try lower

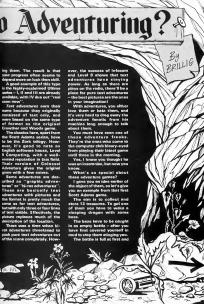

case words as well.

At the moment the computer is responding to our commands as soon as we send them by prassing (Return) but in a calculation or task requiring several steps this can be rether reflects.

It would be more satisfectory to give the computer e whole sequence of instructions that it could get on with rather than spoon-feed it step by step.

with rather than spoon-feed it step by step.
This is possible.
Such a sequence of instructions is called a program end next moeth we will begin writing some.

41! Fun Projects -There's lots to keep you occupied and plenty of ideas for you to develop in this storehouse of fun

IF you have toddlers who are just starting to spell, the delight they show when you run this program will amply repey the effort of keying it in. The idea is that you use a crane to

The idea is that you use a crane to pick up letters being carried by the Alphabet Trein in order to spell the word displayed at the bottom of the ecreen.

Because the word is on-screen the whole time, even children who are not yet ready for epelling cen gain important practice at shape match-

Important practice at shape matching.
Only a portion of the train shows at any one time, but the letters are arranged in alphabetical order. Moving the joyetick from side to side or pressing either of the cursor errow

keys - the ← or → without using Shift or Control - moves the train across the screen. Press the joystick button or the Space har and the crane lifts up the

Learning to spell can be fun when you load up the..

e letter, which it then deposits on e e waiting dumper truck. It's possible to pick up an incorrect letter, but the e efficient workers won't let it drop on to the truck.

Once the word has been built up, the truck rolls off to the word factory to the accompaniment of a marry

to the accompaniment of a marry tune.

Alphabet Train was written by Stan Ockers who contributed it to the Oregon ACE public domain library.

We've made a couple of changes to the original including the facility to use the keyboard instead of the joystick.

The words are held in the OATA statements of the subroutine which

starts at line 1008 so it's not too difficult for you to include your own words of special significance to your children.

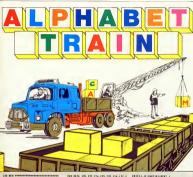

If you replace eny of ours or add your own, make sure the number after the RNO(0)* in line 1010 corresponds with the totel number of words in the data statements. If the number is amillar than the number of words,

is amaliar than the number of words, the words on the end of the list will never get chosen.

More importantly, if the number is bigger than the number of words, the program may crash with se ERROR 6 otherwise known as OUT OF 0ATA.

program may crass with an Enround
— otherwise known as QUTOP QATA.
Also, don't include a word which
has any letters repeate because the
Alphabet Train has already
become a firm favourite with our
toddlers. If they piesy with if for much
longer they il never get the next issue
of Araot Vasor off to the printers!

Trade Enquiries Welcome

Get in the right **Mode for** screen displays

First in DAVE RUSSELL's series on graphics modes though, you cen't write freely across

IN this series we'll be looking at the Ateri's various graphics modes and exeing what each is capable of displaying You may have read some of this information before, or you may have

discovered some of it by eccident. If you think you've found something thet nobody else knows, write and shere it with your fellow reeders If we're oning to look at the Ateri's graphics modes, we might as well stert as the mechine itself does - with

Mode 0. This is the default mode, the one which eppears when the machine is switched on and no program is present. It's a large blue rectangle with a black border, and text appears on it in light blue

Although Mode O is one of the graphics modes and is invoked by the command GRAPHICS O for GR O), it is more usually thought of as a text mode. It is used mostly for entering and displaying the letters and numbers which make up text. although it does have some 'oranhic capabilities as we'll see later in this The blue rectangle can be thought of as the piece of paper on which you write your text. Unlike ordinary peper. the screen In fact, it's more like greph paper,

divided up into little boxes. Many forms that we have to fill in these days have rows of boxes where you write your information, and usually there is an instruction to write only one character in each box. A text screen is like that, and Mode

0 has 24 rows of boxes, with 40 have noticed that the word READY doesn't appear at the leftmost edge of the screen. Unless you do something to elter it, the default setting is for only 38

cherecters in a row. The 'missing' two 10 FOR A=1 TH 4 28 PRINT "1234567858": ZM MEXT A

IN CRAPHICS H 28 FOR A:H TO 15 IN SETCOLOR 2.0.0 AR FRM DELAYES TO DRIVERENT DELAY SE SEST A

DE CRAPHICS OF Listing II

characters form e margin down the left hand side of the screen If you want to count the hours on a row, type the numbers 1234567890

repeatedly. As you type the fourth 8 the cursor moves to the beginning of the next row. Alternatively, type in Listing I and Run it. This will print the numbers for you, and we'll use it egain in a few

It's quite easy to give yourself the full 40 characters. The size of the left meroin is held in memory location 82 and you can see how big it is normally

by typing PRINT PEEK(82) and pressing Return, This should print

the value 2 on the screen. We can alter the contents of a memory location using the POKE command, as long as we specify what number to enter there. So if you type:

POKE 82.0 and press Return, the word READY will appear at the very edge of the If you entered Listing I, it should still be in memory unless you've since typed New Run the progrem agein,

and this time the 40 numbers will fit neatly across the screen. We can work the same magic on

the right hand margin using memory location 83. If you enter: PRINT PEEK(83)

PRINT PEEK(83)
this will usually return the value 39,
indicating the rightmost column.
Ramember, counting starts at 0,
which is why location 83 doesn't

eentain the value 40.
If you enter:
POKE 83,10

and press Return, this will sat the rightheend margin to column Assuming that location 82 still holds the value 0 that you Poked in earlier, the affect of this poke to location 83 is to give you a screen which is effectively only 11 columns wide. The blue rectangle stays the same.

size—It's just that you can't type on as much of it now. To see the effect, try nuring Listing I egain.

If you've been playing about with locations 82 and 83 and want to get back to the default values, you always press the Reser key. This will Distrailly II re-set the values without losing any program you had in

memory.

8 elore leaving the text aspect of Mode O, try:

POKE 755.4

Normal service can be resumed as soon as you return location 755 to its more usual value of 2 - or press Reset if you find it hard to type in Outback Model

The Atlant has several registers.

which hold information about various things. Five of these contain information on colours. They are numbered from 0 to 4, and colour register 2 holds the colour in which the Mode 0 screen appears.

We could POKE particular

a could PONE particular locations to change the colour, but Aari Static offers us a more elegant method—the SETOUDR command. To use this commend we need to know three things: the register number which we want to affect, the colour number which we want to put there, and how bright we went the

These three parameters must follow the command in the order in which I've given them. The default colour for register 2 is colour 9, the blue you know and love. To change this colour, all we need to

colour to be.

do is key in: SETCOLOR 2,4,4 If you've just entered this, your screen is now aglow with colour 4, or pink as we call it. If you want to get rid of colour altogether, try:

SETCOLOR 2,0,0
This produces a very dark grey and

the Mode O screen blands with the border to give the effect of a much larger screen. Of course, text can still only be entered in the area which is usually coloured.
If you enter Listing II and Run it.

you'll see the screen cycle through the range of 16 colours available before returning you to the default colour. Notice that because Listing II

colour. Notice that bacausa Listing II uses the same line numbers as Listing II, it will overwrite it in mamory.

Only the second parameter, the one controlling the screen colour, is

one controlling the screen colour, is varied. The luminance remains at value 8 for each colour displayed. Incidentally, the purpose of line 40 is simply to keep each colour on the screen long enough for you to see it If you ramove line 40 and run the

Thank Atari for a decent reset function which many other micro owners

flash as the colours are displayed at vary high speed.

The colour information for the Mode 0 border is held in register 4 and we cen after this in the same way.

and we can after this in the same way as the text screen. Enter: SETCOLOR 2,0,0 and you will have a completely block

and you will have a complete screen. Now try entaring: SETCOLOR 4.9.4

This alters the register controlling the border colour so that it now contains colour 9 - the colour we usually essociate with the text portion of the Mode O screen.

Well, we've had upside-down text so we might as well have the usual

colour relationships reversed tool Reset will restore the registers to their default values ... or maybe you prefer having white text on a black background.

We can make the honder cycle

We can make the border cycle through the available colours by simply chenging line 30 in Listing II to

> 30 SETCOLOR 4,A,8 That is, by changing the colour in

register 4, we alter the border colour rather than the screen colour. The brightness of the letters on the screen is controlled by the contents of

register 1. However the colour of the latters is always the same as the colour of the text screen. If we set the luminance parameter of register 1 to a bigger number than

of register 1 to a bigger number than the luminance paremeter of register 2, then we (probably) get 'light' text on a 'dark' background.

a, tief we got about your factor on a 'dark' background.

If we set register 1's luminance to a smaller number than register 2's, we (probably) get 'dark' text on a

light' background. To see this effect, press Resat and then enter:

then enter:
SETCOLOR 2,1,8
This produces a gold screen with

palar text. If you now enter: SETCOLOR 1,1,4 the screen stays the same but the text

the screen stays the same but the text changes to a darker colour. So why use the word 'probably?' The luminance parameter can range from 0 to 14, but only even numbers

are valid. If you enter an odd number, the luminance is set to the number you entered minus 1.

This means that if you set register

1's luminance to 9 and register 2's luminance to 8, then both are effectively set to 8. If you change line 30 in Listing II to

read:
30 SETCOLOR 1,1,A
end run the program you'll see the
text cycle through the luminance
values. Strictly speaking you should

values. Strotty speaking you should change line 20 to read:

20 FOR A=0 TO 14 STEP 2 but it won't do any harm if you don't bother. Each luminance will be displayed for twice as long as each colour was displayed previously.

For the final disappearing act, enter: SETCOLOR 1,1,4 Assuming you were back in the

blus, the luminance in register 1 is now the same as that in register 2. This means that the text is now displayed at the same brightness as

the background.

Unfortunately, the practical effect
of this is that the text is rendered
invisible. Unless you onjoy flying
blind, press Reset onco again.

blind, press Reset onco again.

And while you're pressing it, say a quiet 'thank you' to Atari for a decent reset function which many other micro owners would envy.

HEXER is a bexedecimel loader. It is a very useful utility that ellows you to enter, displey and execute mechine code routines. Once the program is RUN, a menu will be displeyed with five options.

1 Enter code 2. Execuse code

3. Alter code 4. Sun rede 5. End propres The choice is now up to you. To

select one of the options press the corresponding number key. Option 1 ellows you to enter e series of hexadecimal bytes into memory. The first question you'll be Start eddress?

You should now enter the address

where your musine begins in hexadecimel without the \$ sign - this is A default eddress (\$4000) will be selected if you press Return without en eddress or enter e hex number \$4000 is a safe area of memory

and should be used to accommodate your first experimental programs After the start address has been entered you will be prompted with:

Here the program is esking you for the hexadecimal number that you want to store in memory, starting at the eddress you've just selected. Now you can begin entering your

program, one byte at a time, pressing After each number is entered the byte?' prompt is repeated, indicating that the previous byte has been entered into memory and that the memory eddress has been incremented by one. The program is now ready to accept another byte. gram you can exit by entering S in response to the byte? prompt. This

It sounds like

the Black Arts

find something

KEVIN EDWARDS

magical about

helpful utility

for displaying

...and vou'll

will return you to the menu If you enter an involid hex number - such as 40G1, where G is not a hex digit - the message 'Invelid HEX I

will be displayed. After which you will Option 2 allows you to examine memory eight bytes et a time. Agein, the first question you will be

asked is: 'Start eddress?'. If you simply press Return it will default to \$3FF8 Let's assume that we've entered 4000. A row of eight bytes will be

displayed. Here is a possible output: 4669 AT 28 60 28 48 48 48 48

The four digit hex number corresponds to the memory eddress. of the first byte in the row - the A9.

and executing machine code routines . . . The next byte in the row, 20, is the When you've entered your proconcents of location \$4001, And from

this I'm sure that you can see that \$4002 contains 8D, \$4003 conteins 20 and so on. If you wish to see another row of bytes neess any key other than S. as S.

returns you back to the menu.

Ontion 3 works in a similar way as Oction 1. The difference being that the memory location being altered is displayed along with its contents. As with Option 1 the promot

'byte?' indicates that the program is ready for a byte. Now you can begin entering numbers in the same way as Option 1.

Agein, a stert address will be requested. This is the address that

will be executed. Since this option can prove deadly e further prompt will esk you if you ere ---28 MEM CC2 STORT USER TO HEM 48 69AP82C5 8 Se elm asciel, sives (ce) 60 OPER 81 4 6 "Y" 101 7 17 Way Bay!-"17 118 7 "L. fater code"

low byte of the parameter is pushed before the high byte. And below all of thesa bytes is the return address of the routine. The naughty thing about USR is

The naughty thing about USR is that an additional byte containing the number of parameters pessed is pushed onto the steck just before the routine is jumped to, even if no paramaters are specified (when it

Thus, even though you've pulled your parameters from the stack when the ReTurn from Subrautine (RTS – \$60) is executed, the return address is incorrect and the 6502 jumps to the wrong eree of memory.

The remedy to this is to pull abyte

off the stack with PLA before executing the RTS - to remove the offending byte. So the end of ell your routines

should have the following two bytes: i8 - PLE (receive the extra byte) i8 - RTS (return back to hexer)

Without these bytes your programs will elmost certainly hang up. Option δ allows you to exit from

Hexer:
And thet completes the description of Hexer's commands. Now we'll have a look at the program itself. The problem with Ater Basic is

that it has no commend to evaluate or print hexadecimal numbers.
The subroutine starting at line 1000 and ending at 1110 evaluates a hexadecimal number held in the variable AS and returns with the

result in the variable RES.

For example, if A\$\(A\)\cdots = "C" and the routine is called, the variable RES will contain 12 on exit.

If you remember, pressing Return without entering e hex number causes the program to default to location \$4000. Line 1010 of the subroutine is responsible for this. If the string AS contains nothing (***)

RES is set to 16384 (\$4000) end the roudine is evited. Another check the routine performs is to see if the hex number has more then four digits. If it has the routine nutils AS end jumps to line 1010, which in turn sets RES to 16384 and exits. This is done because the 6502 micro-processor

Character and Fessil after authorized to the Character and SCIII code authorized to the Character and SCIII cod

Table I

can only address location 0 to SFFFF.

Now the number must be validated. This is done by scanning though each character in the string checking to see if it is a valid hex digit (0-9, A-F).

If an invalid hex digit is found a message is displayed indicating so. The FOR TO loop and GOSUB address are then POPped off the Basic stock and the routine RETURNs

to the menu – see line 1080.

As each character is accepted e number is subtracted from its Ascil code. The number depends upon the character.

If it is e numeric character, 0-9

(Ascii codes 4B to 57), 4B is subtracted – to get e result in the range 0-9. If it's an alphanumeric charocast A-F (Ascii codes 65 to 70), 55 is subtracted – to get a result in the range 10-15. All this does is change Ascii.

1873 1872 1871 1878 4876s 256s 16s 1s

Olasvan (

characters 0-9 and A-F into their corresponding numeric values. See

The result of this is then multiplied by 16 to the power of the LENgth of the string, AS, minus the equal position, minus 1 – the most significant digit is et the start of the

string and not the end.

Have a look at Diagram I.

So from the diagram you can see that \$13C2:: (1*4096) + (3*256) +

that \$13C2:- (1*4096) + (3*256) + (12*16) + (2*1). This is exectly what the program

does with the hex digits in AS.

On exit from the routine RES has
the rosult

The other important routine outputs a byte in hexadecimal – lines 2000-2070.

On entry, the variable A contains the number to be printed. This is spiti into two rybbles (two 4-bit numbers). The top four bits of A make one nybble (the upper nybble) and the lower 6-bits make the other (the lower.

Splitting the byte in this way allows us to print two hex digits because each nybble directly correspends to a hexadecimal digit. Now all we have to do is print the Ascii character that corresponds to

each nybble.

If the nybble is between 0 and 9 wadd 48 to it to get an Ascil cheracter 0-9. If the nybble is between 10 and 15 we add 55 to it to get an Ascil character A-F. This is all done by another subrouline which starts of line 2040.

Line 2010 extracts the upper

rybble from A end prints it. The same is done in line 2020 and 2030 for the lower nybble.

The mein body of the program is

responsible for prompts and simple varidation.
If you're wondering what line 60 in the program does the simple asswer is it OPENs a keyboard file for input. This is done to allow us to wait for a key depression by issuing a GET+1A.

command. After which the variable A holds the Ascii code of the key pressed. Anyway, it's time for you to try out your own programs using Hexer. Hency Codinal

WELCOME to the first in a series of erticles in which we hope to take the mystery out of underatending the fundamentals of the Ateri's workings. All too often even competent Basic

programmers tend to shy off such topics as binery coding, hexadecimal and assembly language because it seems too "mathematical".

This is a great pity, because the Atari is so constructed that a little knowledge in these fields allows you to take full advantage of its advanced

The methematical aspects of the source who can follow Bosic should he able to cone with this series. If you feel that desoite our best afforts we still haven't explained something fully enough, please write in end tell us - we'll try to rectify the situation in later articles.

First we are going to look at binary code - a way of handling numbers essential to our understanding of what goes on inside a computer

Binary is just e wey of coding numbers in a way particularly suitable for computers. It's ectually quite simple. What often confuses beginners is the fact that the binary system codes numbers in a way that can look extremely like the way we normally code numbers.

For example, if you were presented with a number 100, you would probably decode it in your normal way and say it was "one hundred" That, however, is just one way of interpreting it. If you decided to decode it as a binary number you would interpret 100 in a completely different way and say it meant the number "four," (Never mind exactly how you arrived at that conclusion for

This is what often causes problems - people are so used to dealing with their numbers in the normal way that 100 is elways "one hundred" to them and they can't make the shift necessary to decode it in binary as "four".

Actuelly it is rether ambiguous. Presented with 100, do you interpret it as "one hundred" or "four"? Our rule will be, if you mean our usual way of dealing with numbers (the hundreds, tens and units you learnt at school - or put it more formally, the

It all adds up to binary code Part One of MIKE BIBBY's

easy-to-follow series looks at the number system at the heart of your Atari

denary system) you write the number If you wish the number to be decoded as a binary number you put the symbol % in front of it - 100 means "one hundred" while %100 meens "four". So far so good. We now have a marker (%) to warn us that we have to

decode the number in a special way as a binary number However, before you decode you need e rule for decoding - so how do

951002 What's the rule? Let's take a detour for the moment and think about the coins we use avery day. Our currency consists of these cons 50p. 20p. 10p. 5p. 2p and 1p.

We can combine them to give any sum we wish: For example: 75o is 50p + 20p + 5p or 50p + 10p + 10p + 5p

and so on. We are all familiar with this - often we use multiples of coins to make up a sum. For exemple, \$p can be 2p + 2p + 1p Using the same coin twice.

though, often means that we end up carrying unnecessary amounts of change, and I for one don't like doing that. Sometimes, however, with our present coinage system we have to use the same coin twice to obtain

certain sums. You cannot, for instance, make up the sum of 4p without doubling up on coins. To avoid repeeting coins we would have to invect a 4o coin! Let's do that: in fact, let's invent a coinage system where you never

have to use the same coin twice. First of all we would need a 1p coin and, of course, e 2p coin, because we cannot use 1p + 1p for 2p - it breaks the rule! Now 3p can be made up of 1p -2p, but for 4p we'll have to invent a

4p coin. Equipped with that we can make 5p (4p + 1p), 6p (4p + 2p), and 7p (4p + 2p + 1p) In obtaining 7p we

used all our available coins so now we have to invent an 8p coin. If you work it out (and I suggest you have a gol you will find that with the coins you have at your disposal (8p. 4p. 2p. 1pl you can make any sum up to 15p. Then you would have to invent a new coin, 16p.

Notice how the coms we have created have doubled in value: 1p. 2p, 4p, 8p, 16p. No prizes for questing what the past one is Let's summarise our results in a table (Figure I). Here I have used the columns to show the coins available and the rows to show how the various totels are made up. A 1 in a particular

column means that we use that column's coin, end 0 means that we don't use it. Look at the row for 5p. It has 101 on it. According to our rule. this means we rick out the colos 40 and 1n (end NOT 2n) to make up tha So total.

Now let's get back to computers

by dropping all this talk about coins and redraw Figure I to show the same information but without referring to money - just numbers. Figure II is the new table.

As you can see, there is little change, and we can use this table to encode numbers in general, not just coins. We call this method of encoding the binary system.

a binary number we precede it with %. So if you see, for example, %101 means:

> % 1 0 1 + 4 + 1=5

that is we add together the values of the columns containing 1. Look at row 5 of the table to check it. Similarly, %1101 would mean 13 in the denary system since

By now you should be able to work out for yourself why \$5' 100 represents four. From the table, or by using the addition method I've just illustrated, see if you can decode the denary values of the following binary numbers:

%1001 % 101 % 11 %1101 % 111

You can use the program accompanying this article to check your results. You've probably noticed by now that in the binary system you only use two symbols, 0 and 1, to encode numbers – hence binary, bifor two as in bicycle.

You can encode any number that you want in binary - just use more

Bit Wise

columns (or "bits" as we say in early new hit is worth double the

However it does get terribly cumbersome. For example, 100 (denary) encoded in binery is

%1100100 since: 64 32 16 8 4 2 1 1 1 0 0 1 0 0

± 64+32+4−100 It is much easier to hendle the

number in our normal system. To a computer this presents no problem, represent numbers with a sequence

Switches are what we call "two stete" - they're either ON or OFF. If we have a sequence of four switches together we can encode numbers by having them either ON or OFF, We

could use ON to mean a 1, and OFF to mean a 0 in a particular column: 4 2 OFF ON ON 0 1

Each of these "switches" recensents a bit, and a computer memory is full of bits. The 6502, which is the microprocessor at the heart of the Atari system, deals with many

thousends of them. To make things simpler the 6502 hendles the bits in groups of eight bits et e time - the group of eight being

With this type of organisation the largest number you can store in a byte is 255 since:

called a bute

128 64 32 16 8 4 2 1 % 1 1 1 1 1 1 1 1 1 · 128+64+32+16+8+ 4+2 +1=255 Of course the comouter can bandle

> 149 128 126 gees - set to 1 64,32 can't go - set to 0 16 goes - set it to 1

-16

_1 1 gass - set to 1

8 con't go - set to 0 4 goes - set to 1 2 con't ge - set to 0

larger numbers (and not lust whole numbered but to do so it must use more than one byte Converting a byte from binary to

denary is fairly straightforward. Simply write it down under the appropriate column for bit) values and add together the value of all the columns in which e 1 occurs. For example, given %10010101 you trenslete es follows:

> 128 64 32 16 8 4 2 1 % 1 0 0 1 0 1 0 1

128+16+4+1=149

at all difficult, but is rather hard to put into words. You do it by subtrecting

from the number you want to encode the value of each column in turn. sterting with the highest (i.e. 128, 64, 32 and so only If you can subtrect a perticuler

column value you put a 1 in that column end continue to subtract the next lower column value from the If you cannot menage the subtrac-

tion you put a 0 in that column and try to repeat the subtraction with the next lower column number. So, starting with the highest column number (128 in our case).

1. Attempt to subtract the relevant column number (highest first). 2. IF you succeed THEN put a 1 in that column number and continue to subtract other columns from the remainder. Otherwise, put a 0 in

Figure III should make it clearer. In practice when faced with encoding a number from depart to binary I tend to do it in my head. seeing which column values will add together to make the sum required. starting with the highest first.

For example, if I were to encode 161 in binary I would say, "Well, I can use 128 so that leaves me 23 to find 33 cen be mede up of 32 and 1 so that does it: 128+32+1-161 So I

128 64 32 18 8 4 2 1 % 1 0 1 0 0 0 0 1 = %10100001

After a while you'll find this way quite simple.

To finish off, I'll leave you with a program to print out the binary value of a number between 0 and 255 (i.e. that can be stored in one byte). Try it

18 TONE 198 20 EROPHICS 8 38 CPER #1.4.8."0;" 48 * CHOS (175) SE POSTITUE 5.5 SE POTAT "Busher": 70 IMPUT OFFEET

nory intensive programs such as word processing or spreadsheets. The 130XE is the first of a brand new family of Atari computers - yet it's compatible with the widest range of software in the world! £169.99

All priors include UAT

PETE BIBBY examines the Atari's sound chip and reports, regretfully . . .

AS you'll already know, your Atari micro is a claver little baset. One of the cleverest things about it is the sound chip it contains which allows all menner of wonderful (end not-so-wonderfull noisea to eccompany your programs. Howaver there's always a fly (or is

it a bug?l in the giptment of microcomputing. With Atari sound it's the fect that, at first sight at least using the sound facilities needs an IQ somewhere near genius. In point of fact, when you take the

time and trouble to get to know it you'll find that although the sound chip is complex, using it needn't be all that complicated. You just have to take it one sten at a time. However, et first sight ell the

PEEKs and POKEs and registers can be quite offputting to the would-be Atari musicien. This is a pity because you can achieve a feir command of, Atari sound using just one simple Basic command, the aptly named SOUND command This is the one we'll be exploring in this article. The SOUND commend takes the

\$8000 channel, gitch, distortion,

Don't worry too much about the parameters following the SOUND. Wa'll deal with those later in the article. For the moment, thrill to the sound of your Ateri by typing:

53180 0, 200, 10, 0

and pressing Return. Unless you're deaf, you'll notice two things. The first is that the note produced comes from the television. If you don't believe me, try turning the

TV's volume control and heer the difference The second thing you (and the rest A quick plance at our formula for **It sounds easier** than it looks

the SOUND command shows that there is no parameter controlling the length of the note it produces.

Other micros have a duration parameter. The Ateri has none. So when you enter a SOUND command directly into the micro the note just carries on By this time the note produced by:

SCHOOL 0.200.10.0

will probably be getting on your perves. There are three ways to stop it, not counting a sledgehammer. The first two are either to switch off the

micro or hit the Reset button. The trouble is that these are a bit drastic. A much more elegent solution is to

SOUND 8, 8, 8, 8 which in effect tells channal 0 to shut up. But now I'm getting eheed of

myself, as we haven't met channels yet As you'll know from some of the games you've played, your Atari isn't limited to playing just one note at a

time. It can produce some quite complex hermonies using up to four notes simulteneously. This is possible because the Atari's sound chip has four channels, each channel being able to produce a

separate note

to 3 and we select which channel a SOUND command uses by putting the appropriate number in its channel perameter. So (ignoring the other

SCUND 8,288,18,0 used channel 0 while

shortly):

perameters which we'll come to SOUND 3,200,10.8 plays its note on channel 3. Notice

that to switch off the sounds, you 92202 0.0.0.0

for channel D and: SDING 3.0.0.0 for channel 3.

The more suspicious of you may thick I'm cheating. After all the note was the same on both channel D and channel 3. Maybe there's only one

channel. For the Doubting Thomases use some of the other SQUND perameters to play a chord using

Now do you believe me? If you switch off the notes with:

you'll not hear the four channels, if you see what I mean.

So to sum up, we've found that we

can use the SOUNO command to meke a noise on one or more of four sound channels. This noise cerries on until we switch it off with the appropriete:

SCEND channel . P. B. B. where channel takes e value from 0 to

Incidentally, have you tried using other channel numbers such as 5 or -1? It's not allowed. You'll find you

pet en error 3 message. When we played our four note chord earlier you may have noticed that each SOUND commend had a different pitch paremeter. Channel O had a pitch perameter of 243. channel 1 had one of 193 and I leave it to you to figure out the nitch

parameters for the remeining two channels. It's the pitch perameter that decides how high or low the note is going to be. It can take velues from O to 255. The bigger the number the lower the note produced, the smeller the number the higher the note.

50010 2,248,18,8 and after a short delay: STHEET 7, 16, 18, 8

Enter:

and you'll hear what I meen For the musically inclined, the renon of values from 0 to 255 gives over three octoves with middle C . being equal to 121.

The trouble is that there is no stendard increment or decrement in the pitch parameter which correspends to a semitone. You either have to look them up in a table or play them. by eer. I prefer the second technique. There is one rule that the pitch parameter does follow, and that is the rule of octaves. If you halve the value of a pitch parameter you get the same note an octava above. If you can't follow that, or don't know what en

octave is, playing: 50000 0.284.10.0 followed successively by:

SOURC 0, 180, 10.0 SZEND 8.58.18.0 SECRE 8, 25, 10, 8 should show you.

The more inquisitive may wonder what happens if you carry on the shove experiment and enter: 90000 8,12,5,18,6

Try it and see. The Atari expects

whole numbers in the pitch peremeter. In this case it rounds 12 5 up

As we've said, the pitch perameter can vary from 0 to 255, with 255

giving the lowest note, 1 the highest and 0 silence. What happens if we wander outside this renge? If we use a negative pitch parameter, the micro doesn't like it and comes back to you with en error 3 message. However if we use a number higher than 255 then, rather then bring things to e helt, the micro keeps on taking 256 away from the

expessive pitch parameter until it is within range. More technically, it takes the pitch parameter MOD 256. Hence: SOUNG 2,386,18.8

andi

produces the same note as: SOURC 2,44,18,8

\$00MD 2,556,18,8 even though the pitch perameters

involved ere vastly different, Now that we've got halfway through the paremeters of the SOUND command, let's use them in e program such as Program I. Type it in and Bun it

LO REM PROGRAM I 28 50000 8.243.18.6 38 90000 1,193,18.8 48 50000 2,162,10.8 58 50000 3,128,18,6

Not very exciting, is it? It's all over in a flash. What has happened shows us the way the SOUND command differs according to the circumstences in which it is used. When it's entered directly into the micro, as we were doing up until Program I, the notes produced just carry on and on until we stop them or play another note on thet channel.

However when we use them in a program the notes produced lest only as long as that program. When the program ends, so does the note. Try extending the life of Program I with a delay loop such as: 68 FOR BELRY-1 TO 1989-WEST DELAY

and you'll heer the chord.

This is the method of getting round the afore-mentioned lack of a duration perameter Crafty use of varying delay loops can ensure that the notes produced by a SOUND

command are as long or short as we desire But enough of this making up for a paremeter we lock, there are still two peremeters we haven't discussed yet,

involving distortion and volume. The distortion parameter actually distorts the sound played by e channel. Taking values that range from 0 to 14 in stens of 2, it's the distortion paremeter that allows the Atari to produce all the special effects

sounds like explosions and mechine guns. Program II will let you hear it at work. Try it out with notes of pitch other then 200 and heer its effect.

> LO REN PROGRAM 11 28 FOR DISTORT-8 TO 14 STEP 2 38 PRINT DISTORT 40 SOCRO 8,280, DISTORT, 15 SO FOR DELAY-1 TO 1999-MEST DELAY AR MENT RISTORT

You'll notice that a distortion of 10 gives en elmost pure note, hence I've been using it in the exemples so far. A distortion of 14 is also acceptable as an unadulterated tone

As before, if you use a negative distortion you're rewarded with enerror 3 report for your pains. If you use velues outside the rence you'll find that the Ateri uses the distortion

MOD 16. This means that: SQUAD 8,288,24,15 produces the same note es:

53190 0.200.10.15 The final peremeter in the SOUND

ERROR 3

If we use a negative pitch parameter the micro doesn't like it

ENGLISH Software has released three volumes of Ateri Smeath Hits, but we've only had Volumes 2 and 3 sent for review so I won't be saying

much about Volume 1.
All these volumes contain
Jet-Book Jeck, probably the
best-known of the games, in
fact, it you haven't already got
Jet-Boot Jeck it might be
worth buying one of these
volumes to fill the hole in your
collection.

In addition to being a good gene it has several features which other manufacturers would do well to oop, like the facility to set the skill level and the option to skip level level As well as Jack, Volume 2 consists four other games to keep you armaed. They're to all eroads games either. Streamed in on deventure

Strander is on adventure germs in which you play the part of Spaceal Agant Sid-avan if you are a woman! You've been dumped on a strange placet and your missings placet and your missing in a crum home safely. The germs uses fairly simple lime drawings on the top half of the screen, with the location describers and commands of the placet.

appairing on the lower helf.
Thera's a Help facility, if you're stock, although the hints aren't always very useful, and the game can be seved and rabadied at any point. Meanwhile, back at the jostick, Dimnosis casts you in the role of Digger Dan the prospecting man. Your task as to collect all the diamonds to collect all the diamonds.

as Brain the Blob and Phil the Filter
There are 16 livels so it will keep you bissy for some time.
There's a presen fectity which i found essential so I could have a wirst-rest, because the game areas to be very allow at reading the joyatick— as the property of the property of the transition of the property of the This resulted in my applying

extra pressure, hance the need for a brask. The Adventures of Robin Hood is not ectually an advanture game. Robin's task is to collect the bags of silver and kiss Maid Marian will evolding the arrows of the

He moves along a horizontelly scrolling landscape and

SMASH HITS 3 COLLECTS THE LOLLIPOP

has an emazing ability to climb up trees and buildings. As the levels increase, so do the number of bags of silver to be collected. The skill level can be selected.

I must admit I got board

vary quickly with this one, dispits the interesting Olde Biglish computer music.
Closeld Warnier, the last of the five on Votamo 2, is a two-dimensional scrolling maze which you must explore in order to defuse the cyclotron bombs. Since early pert of the maze is visible on the screen, you'very got to enthrober where the fast dumps are. Your fast is used up et as used up et as used up et as

as ounds simple – you have bu
build a well by catching bricks

encountered it before it sounds simple – you have to build a wall by catching bricks as they fall off a conveyor bet However, to be successful requires speed, ecouragy and some strategic thinking. The bricks drop quite fast and as deady if they het you, in order

to catch them, you must be directly below with your annaraised.

There are four shades of brick and in order to maximise points you must build the well

points you must build the well in a set pattern. If you don't throw the bricks accurately, they don't always and up where you intended and may well spoil the pattern. You must also consider the pettern in deciding whether to catch env particular brick, or

be quick to move out of its On level 1 you only have the bricks to contend with. On higher levels - there are eight altogether - there are boxes of TNT moving ground your least to make life difficult.

The TNT makes level 2 a los herder then level 1 - I would have preferred a more gradual trensition between levels. Even so, it's still a good game By including Rreath Of The

Dreson, Volume 3 uses e technique borrowed from the record industry. It's not uncommon for a 'greatest hits' album to contain one praviously unreleased track, so why should notowere houses

be any different? The game is a sort of edventure geme but requires ercade-type skills. You are trapped in the inner sistle of a double mese which you must explore in order to find enough the outer meze - elweys

assuming you can find the The dreoco is just one of the hazards to be evolded as you room eround. The walls and ceilings are fatel to the touch. as ere the mobile false teeth,

the gient spiders and other assorted nasties It's one of those gemes which take a while to develop as you learn the various skills -We lumping over the rubbish without hitting the ceiling. The instructions leave you

to work out the various possible movements and it was a while before I realized I could lie down . . . not like me Once you get the hang of It there are aix selectable skill

levels to keep you busy into the night. Finelly on Volume 3, Neonos's Daughters await rescue by an immedia agustmen who ebsorbs oxygen "through the oils on the side of his neck". suppose if you're going to have gills, you might as well have

them there. You are armed for should I say figned?) with an unlimited supply of harpoons with which to do battle. The foes include aucker plents, en octopus which only gets stunned by the hernoons and killer empelses The action obviously takes because the emorbee are as

big as the aquaman himself. Biology eside, though, the game is challenging enough to play egain, which works out at

The cassette version of esch volume costs £14.95 with the oquivalent discs being £17.95. Of the two volumes I've looked at here I prefer Volume 3 and would consider it much better value. It contains five games that I'd about £3 a gette on the tape Td only go back to four of the games on Volume 2, but because it conteins a "traditions? adventure it might well appeal more to some people than Volume 3. Either way, you pey your money and you get a fair bit of choice. Dave Russell

The Silicon Dream gets off to a pretty good start

IF you go by the numb locations, Snowball must be one of the biggest edventure ames ever. It boests over

7,000 of them, but fortunetely you don't have to man the complete set. According to Level 9, the action takes plece eboard a stership that could actually work. Not having the facilities

to check this atetoment, I'd take their word for it. The Snowball is en eptly containing two million frozen colonists You play the part of Special Agent Kim Kimberley, woken while the ship is in

The fect that you've been woken meens that something is wrong. It's your lob to find out what's happened end save Being besed on e 'working model, the problems to be solved in Snowbell ere logical rether then megical. However, es the menuel suppests, some of the technology used might be described as magical in

1980's terms You start the game in your coffin end your first problem in to get out of it. Pretty soon you

lethal variety of robot thet polices the starship mor-

The game follows the clessic edventure style in thes you ere awarded points for certain ections. There is a meximum score of 1,000, but you can complete the game with a less than perfect score so it's not like having to collect e given number of 'treesures Level 9 have developed a powerful parsing system, so

your input can be a bit more then Get Sword or Kill Dregon. You goo even use IT to refer to the object of the previous commend which saves a lot of time in the long run. Having said that I noticed some anomalies. If you went o break from the game itself, find a safe location and try

typing in the alphabet a letter at a time. Some cere has obvious ter of Kim because even with a picture on the cover of the manual and a personality profile inside. It's not clear whether Kim is mele or female. This means that no matter who is playing the

game they can think them selves into the role.

I reelly eppreciate this aspect - you've no idea how fed up I am of postending to be a heiry-ermed yobbo. In fact I really enjoyed playing Snowball and would

recommend it to envone who likes a good adventive and is fed up with dwerves and My only compleint is the BBC Micro owners get a better deel Presumably by the use of some clever interrupt progremming, the Beeb version of

the tape plays a lovely tune Given that the official Atari tape-deck has an audio channel as well - which the conversationel' series of lannumber tutorists out to need use - Level 9 could have included the tune without

even needing the clever programming. Snowball is the first of a Silicon Dreem trilogy, The second in the series, Return to Edon is now available and if it's es enjoyable ea Snowball I'll be out of circulation for the next few weeks

Elisabeth Dennis

ONE of the best measures of a good arceda geme is tha crowd that builds up around you while you're playing it. Every time I losded Drop Zone from U.S. Gold, people gethered eround me in the Some of them even scored more than me, which meant I had to keep playing just one

The object of the game is to protect the men on the planet from the invedion stiens and

return them one by one to the Orogone where the lending As the press release edthe Defender mould, Instead though, you have a Jetpac type of cherecter who shoots

from the nevel! The 3-D landscape looks like it was constructed from (or was it Voyager?) mission sent beck. It's e Mertien red. and it sorolls beautifully as you

Not thet you get much the eilen hordes couch sight of catch you is what the blurb calls a "voiceso" - like as expensive firework - end hed

could see it ecein Beneeth the lendscape is your "high speed acanning viewer" - a sort of rader on which you can see where the eliens ere. I decided it's celled high speed" because unless I looked at high speed the clians caucht ma while I was still talong the information in You need to sit close to the keyboard in order to make use of the clock and strate bombs

Although you have unlimited fire-power, the closk runs out Score over 10,000 points

and you get enother life end enother bomb. The clock is replenished as you complete each level You'll need to exceed 10,000 to get in the hell of feme too, but it's worth the Life gets hectic when Drop Zone is running

as you enter your installs me, you'll love Drop Zone, It

will set you back £14.95 for 48k. I fell to see why the disc should cost C5 more, but the tepe is worth it if you can stand the 10-minute wait while it loads.

Come to think of it, you might as well use the loading

time to ralex - life will be pretty hectic once Drop Zone

i THINK it's true to sey thet there eren't that many games around where you can bounce off a 90 foot high cemel while trying to blest it with your speceship's neutron cennon. If there ere other gemes in

Attack of the Mutant This is a simple shoot-am

up ercede geme, simple in to shoot the six camels before the difficulties which make it e challenging, end therefore For e stert, control of your

spaceship is not easy. Moving ing in the corresponding direction. Trouble is, once it is moving the ship has inertia Suffice to say that control tekes e bit of practice.

more then once, end they shoot back. If you collide with one, you bounce off with between two camels when you collide, you can be bounced beck end forth. Bouncing is not to be recommended because it depletes

If you can clear the six drive. Whereas in most gemes next level, in Mutant Cemela the hyperdrive is a challenge in

After a weming, you start to eccelerate ecrose the landscepe end a rocket berrege comes toward you. If you don't successfully dodge all the rockets you lose a ship and must clear the same sector Before play starts you can

choose from all levels of difficulty ranging from "Real Cool" to "Like Wow". The reflects the level from an icy blue to a scorching orimson. Atteck of the Mutent Camels is a difficult game to master even at the lower levels, and I enjoyed trying. The tope costs £7.50 and as

on disc.

octore 64 version of P Boyver, I jumped at the chance to raylaw it for Attack User. Maybe my expectations were too high, but I have to say

I loved the storyline and the introductory cartoon, the hour enywey), It's just that I found the game almost unplayable. It didn't seem to respond to the lovetick, so much so that I even began to

think my investick was faulty. But as soon as I loaded another geme the joystick The geme is set in the English gerden where Gordon Bennet is trying to mow his lawn. He's borrowed his

MIKE COOK takes you on a conducted tour of the Atari micro's power house

LIFT the bonnet of many Formule 1 racing cere end you ere likely to see the same engine. OK the cheesis is different, the suspenelon, gearbox end body ere ell different, but most of the enginee ore the same.

This is elso true with personal computers. The microprocessor, the power house of your computer, le the same on many different models. So let's take a look at it and see how it shapes the rest of our machine There are two microprocessors which no to make the year majority of

computers - the ZBO and the 6502 in the Ateri senne the 6502 is used This is the same microprocessor so used in the Apple II. Pet. BBC and Electron, to name a few. They all share the same engine. A heninger is often puzzled why

they don't all shere the seme software. Well the enswer is simple. They all have different electronic "bodies" wrenned round them liust Ike the reging cers. This makes software written for

one machine totally incompetible with env other mechine. Let'e eas how this comes about by looking a little deeper into the structure of the

The 6502 microprocessor was first manufactured by MOS Technology in the early '70s so it is now well over 10 years old. However that does not mean that it is out of date or old technology, as some ac-called experts think. The processor was so advanced when it was designed that only recently has technology been able to make full use of all its features.

It was designed as an Improvement on the Motorola 8800 and mede some redical changes. The

improvement which wento prove the key to its success was not the nower of its anthone instructions but the ease in which it could be made into a system. That is, it could be made into a computer with the addition of very few extra china This made it the natural choice for

early computers like the Apple I (yes it really did exist) and the Apple II. Eventually the company that made it were bought out by Commodore, the mokers of the Pet Given this footbold of populer

computers using the processor, guite a number of people became very proficient at programming it and so they chose it for the next generation of computers. This was possible because the

softwere instructions the processor obeys have turned out to be remarkably powerful. These instrucand ultimately assert the names of the machine because examine the computer does must eventually be broken down to these basic instructions. The ferent instructions you post to everess a problem the faces

the machine will go These instructions ere very simple. Irunhing operations like moving data from one piece to enother or edding up two smell numbers. Most real things you want to do need lots of

these "mini" instructions. Take, for example, e program to print "Hello" on the screen, it is likely that this would take about 20 instructions. To see why this is so we will need to look at how the microprocessor views the outside

To e 6502 the rest of the world looks like lots of different placon

holes or memory locations. It can noly cope with one of these at a time. It signels to the electronice surrounding it which location it wents to eccess by setting the eddress of the location on 16 signal wires

Each signel wire cen be in one of two states, with e voltage on it (5 valts) or with no valtege on it (0 valts) We cell these states one or zero. Yes, 5 units is called one! You see if we

called it 5 then that would imply there wes 4, 3, 2 and 1 These voltage levels cannot exist in the circuit. The circuit can only be in

one of two states - that's why we call it e binery condition. As there are 16 of these eddress sinnel wires there are a lot of combinations of zero and one that they can be in. In fact if you work it

out this comes to 85.536, or as we say in the largon 64k. This is because 1k is 1024, a sort of boker's dozen parties of 1000 So anything connected to the of address space. The wires that

signal this address are known collectively so the address but Up till quite recently 64k was a vest emont of memory, quite over and above anything that was practicable or effordable

I remember in 1978 getting e memory board for one of my computers containing 4k of memory which cost twice as much as the Ateri Even so I was impressed at how

cheep it was, ea it represented quite a big breekthrough at the time. Nowadays you can get 64k of memory in just two chips, ao you are

that technology has only recently caught up with the capabilities of this microprocessor.

The microprocessor axamines the

memory locations by meens of eight signal wires. These cerry information to and from the locations in the same sort of binary (one and zero) signals used on the address bus.

As these wires carry the informetion or data they are known collectively as the data bus. So if the microprocessor wants to look at a memory location it puts the address onto the address bus and reads the contents off the data bus.

Conversely, if it wants to store some information it egain places the address on the address bus and the date it wants to write onto the data bus.

It is up to the electronics surrounding the processor to service its needs by taking or placing the data on the bus.

on the bus.

So the processor sees everything simply as memory locations. All the devices that make up the computer have to be ellocated their own unique address or renge of addresses.

This applies to the kayboard, the screen, cassette recorder, (systicks and whetever else goes to make up your particular computer. If designers choose to put these components in different piticas, or have a different mix of components, then inevitably software becomes incompetible. As well as the external memory.

As well as the external memory locations, the processor has inside it some internal memory locations. These are colled registers, and each one is not given a numbered address but a name.

Admittedly they are not very

Admittedly they are not very imaginative names, but they suffice. They are called A (or the accumulator) X, Y, PC (program counter), S (status) and SP (stack pointer). Each has its own use and every

instruction that the processor can execute involves one or more of these registers. They are shown in Figure 1. Let's take a look at what they are used for. The program counter is the only 16 bit register, and it is used to hold the actives of the next instruction. The

processor puts this out onto the address bus and fetches the data in that location.

This is in the form of a coded Program Counter

Figure 1: 7hm 6502 registers

is executed the program counter is incremented to point to the next instruction.

This can be complicated by the fact

This can be complicated by the fact that a complete instruction can be stored in one, two or three successive memory locations.

The first part of the instruction

The first part of the instruction contains the information concerning how many other locations are involved. In this way the program counter looks efter itself without any intervention from the programmer. If any data needs to be moved or manipulated then the accumulator is used. There are instructions to move data from a memory location to the

If the microprocessor wants to look at a memory location

it puts the address onto the address bus 9

accumulator and from the eccumulator to mamory. Data cannot be moved directly between memory

While deta is in the accumulator it can be manipulated. This can men having a velue added, authrected or having individual bits changed. The instruction set also allows multiplying or dividing by two. All other

instruction but before that instruction operations have to be derived from is executed the progrem counter is these.

The X and Y registers are known as index registers and are used to point to other memory locations. This means that the program can calculate

means that the program can calculate the memory locations to operate on instead of them being fixed when the program was written. This gives the instruction set most of its power. The way the address of memory to

work with is enrived at is known as the addressing mode. The 6502 has quite a few of these and they are at the root of its power. The stack pointer is a bit like the program opuniter, only it points to an

area of memory used for temporary storage. It is restrained in that it can only cover 256 memory locations at a fixed address. This register locks after itself most of the time and can usually be left alone.

The status register is different from the rest in that if does not constaln

numbers as such but e collection of bits. Each bit has its own name and significance.

Whenever any operation tekes place the individual bits in the status resister change to reflect it. Suppose

for example, we subtract two numbers and the result is zero, then the zero flag (single bit of the register) would be set. The point is that all the conditional instructions work off, this status

would be set.

The point is that all the conditional instructions work off this status register for example, if you want to skip a section of code if two numbers are the same, you would use a "Brench if Equal" instruction which cause a seedified number of address.

Hardware

locations to be skipped if the zero flag is set. This then alters the program counter and causes the next instruction to be fetched from further down

The art of using the instruction set to get the computer to do anything is guite involved, and many books have been written concerning machine

code programming Let's finally look et some of the other features of the 6502 micro-

There are three signal pins on the processor which can interrupt the program currently being executed

sionals. rupt is the reset. Whenever this is trippered the processor will go to a certain address location and look for a

With two of these signals the program can recover and continue executing as if nothing had happened These are known as the interrupt The simplest unrecoverable internumber This number it will take as the address to start fetching and obeying instructions. This is the restart

The reset line is automatically pulsed on power up by the surrounding electronics. As the reset is told where to go by a memory location we

say the interrupt is vectored. Two other interrupts are also vectored, the IRQ (interrupt request) and the NMI (non maskable interrupt). The difference is that the NM1 is always obeyed whereas the IRQ can be ignored if the processor has executed an instruction to set a certain bit in the status register, the

interrupt inhibit flag These interrints on earlier comoutars were ignored, but thay can be made to make the computar appear to be doing many things at the same

For example, suppose we want to

see if a key has been pressed on the keyboard. We can arrange the program to keep looking at the memory location where the keyboard is located. Alternatively we can arrange for pressing a key to generate an interrupt, and then the program comes to see what key is pressed Therefore we do not need to waste

time looking at the keyboard when no key has been pressed. The video display can generate interrupts to assist the smooth animation found in so meny good games. Also the interrupt can be regularly triggered to keep track of time by implementing a real time

Well that's a brief look at the engine inside your computer, the device that gives it the power. However ramember it is the surrounding electronics that make your computer unique and give it the many added features not found on others.
